<td>Development of innovative and digital strategies for the care of frail subjects. The present research project is focused on the development of innovative e-health tools, directed to train different cognitive functions (such as, attention, memory, and learning) in the ageing population and in neurological, frail patients affected by cognitive impairments. Such digital tools for the assessment, potentiation and rehabilitation of cognitive abilities, will be tailored according to single-patients'needs and interests. Importantly, to support individual motivation and limit drop-outs, the design of these innovative digital instruments will be based on the principles of gratification (stimulation of intrinsic motivation and creativity) and neuroaesthetics.</td>
